Introduction to the Course

TIME SERIES ANALYSIS IN PYTHON

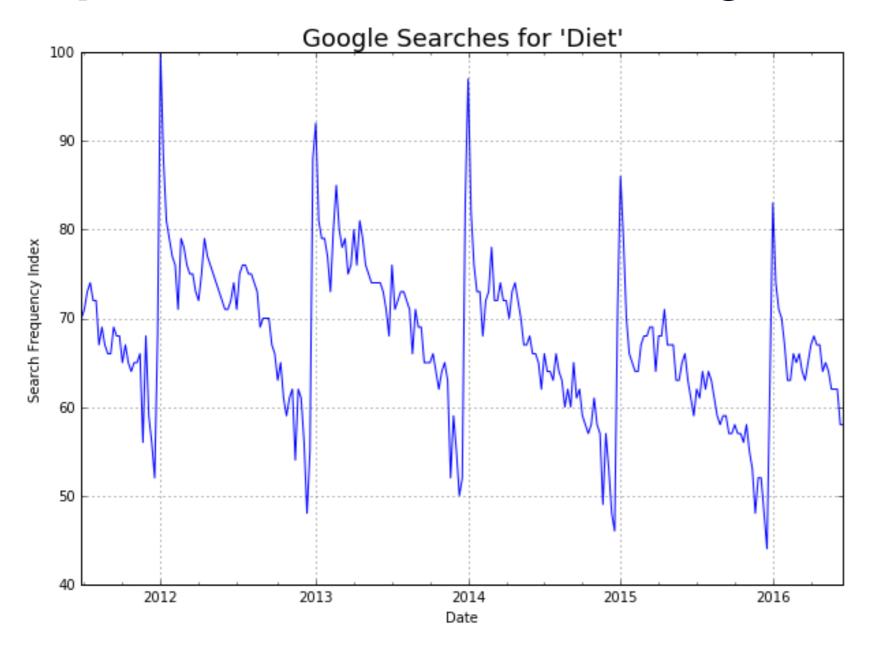

Rob Reider

Adjunct Professor, NYU-Courant Consultant, Quantopian

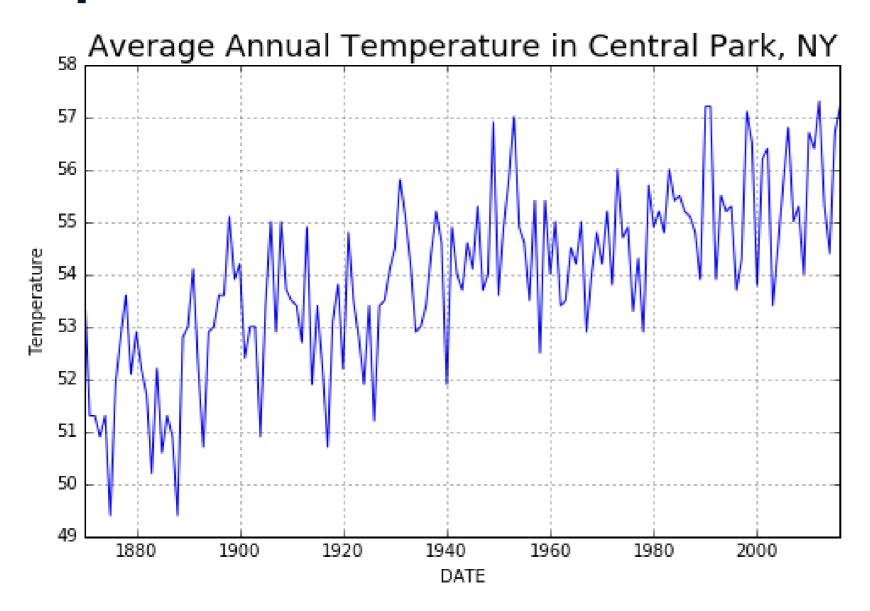

Example of Time Series: Google Trends

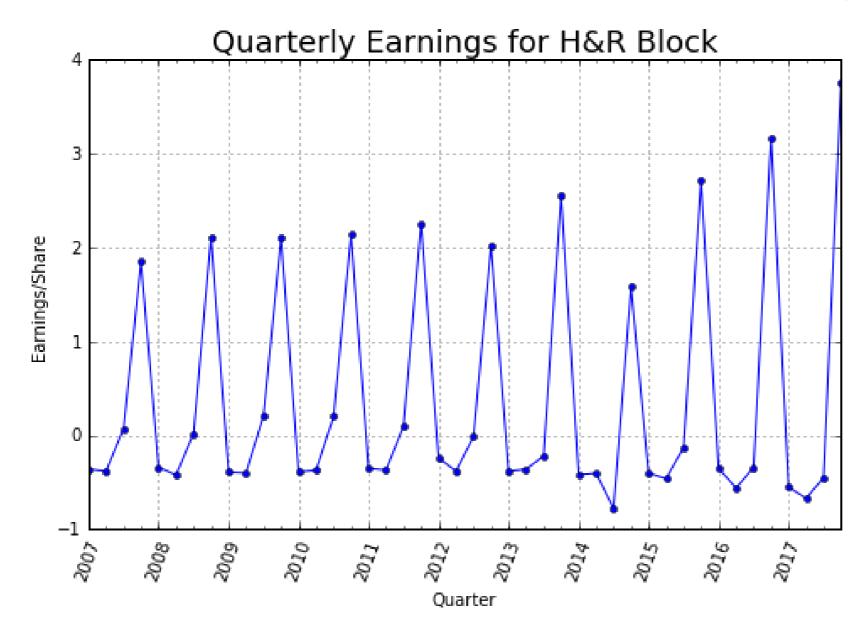

Example of Time Series: Climate Data

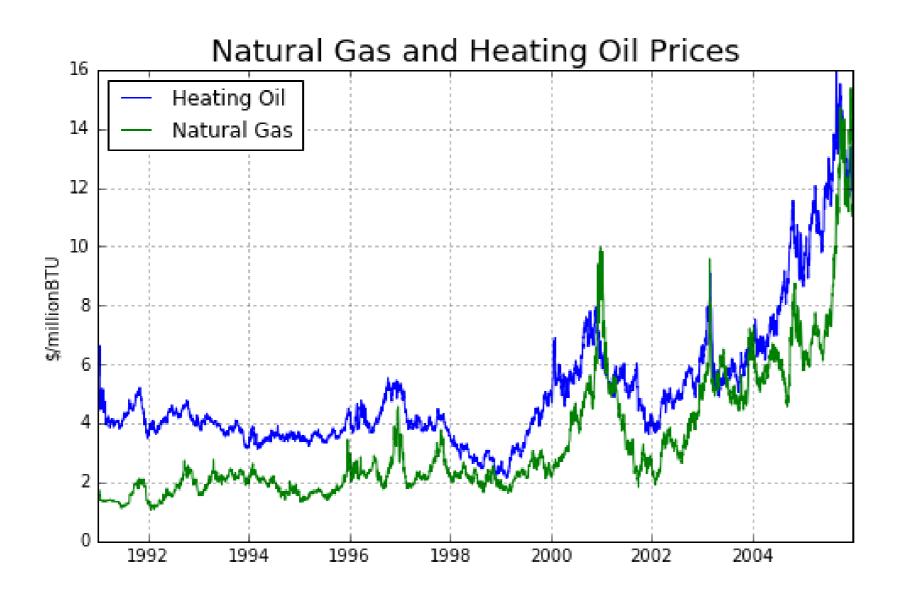

Example of Time Series: Quarterly Earnings Data

Example of Multiple Series: Natural Gas and Heating Oil

Goals of Course

- Learn about time series models
- Fit data to a times series model
- Use the models to make forecasts of the future
- Learn how to use the relevant statistical packages in Python
- Provide concrete examples of how these models are used

Some Useful Pandas Tools

• Changing an index to datetime

```
df.index = pd.to_datetime(df.index)
```

Plotting data

```
df.plot()
```

Slicing data

```
df['2012']
```

Some Useful Pandas Tools

Join two DataFrames

```
df1.join(df2)
```

Resample data (e.g. from daily to weekly)

```
df = df.resample(rule='W', how='last')
```

More pandas Functions

Computing percent changes and differences of a time series

```
df['col'].pct_change()
df['col'].diff()
```

pandas correlation method of Series

```
df['ABC'].corr(df['XYZ'])
```

pandas autocorrelation

```
df['ABC'].autocorr()
```

Let's practice!

TIME SERIES ANALYSIS IN PYTHON

Correlation of Two Time Series

TIME SERIES ANALYSIS IN PYTHON

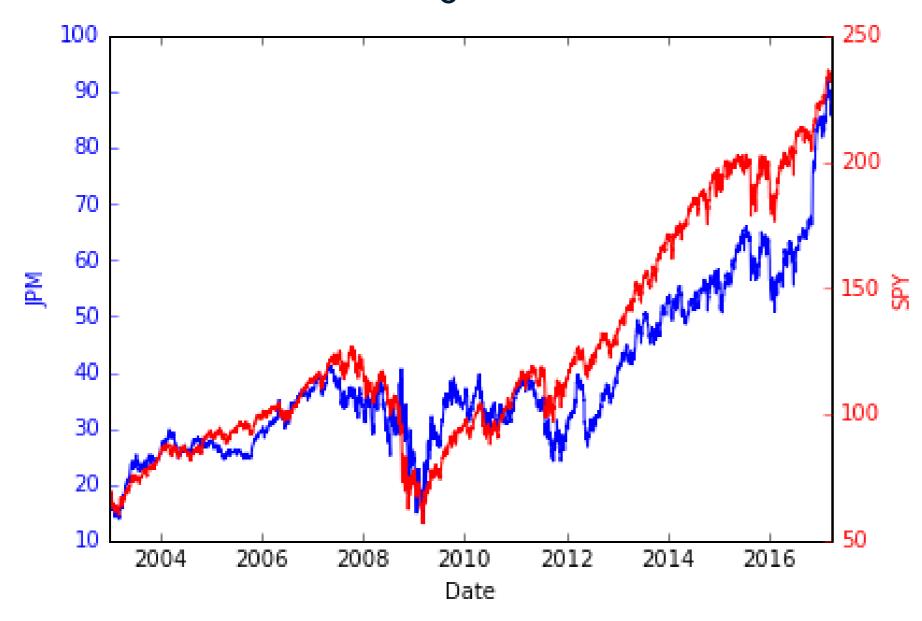

Rob Reider

Adjunct Professor, NYU-Courant Consultant, Quantopian

Correlation of Two Time Series

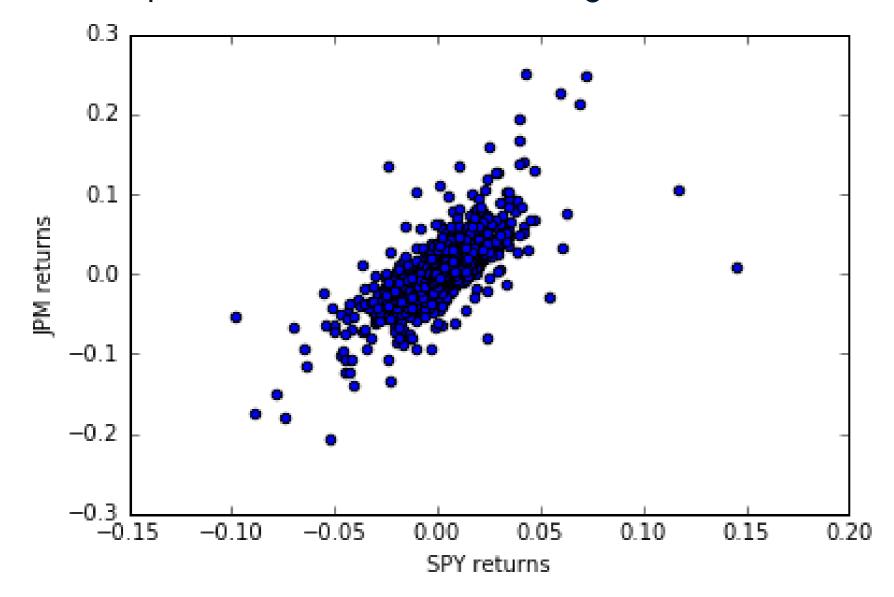

Plot of S&P500 and JPMorgan stock

Correlation of Two Time Series

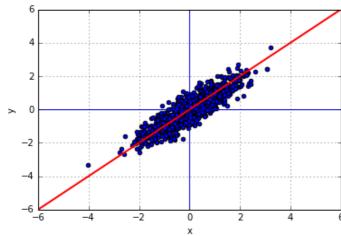

• Scatter plot of S&P500 and JP Morgan returns

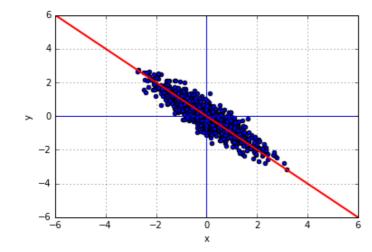

More Scatter Plots

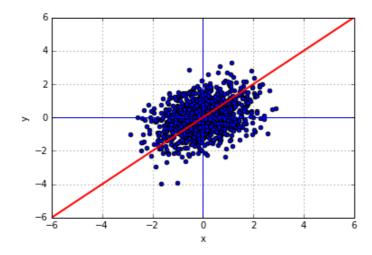

• Correlation = 0.9

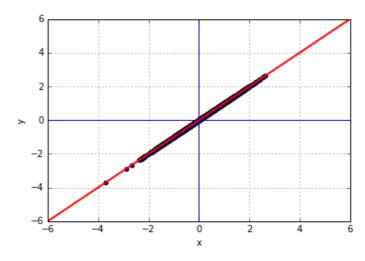

• Correlation = -0.9

• Correlation = 0.4

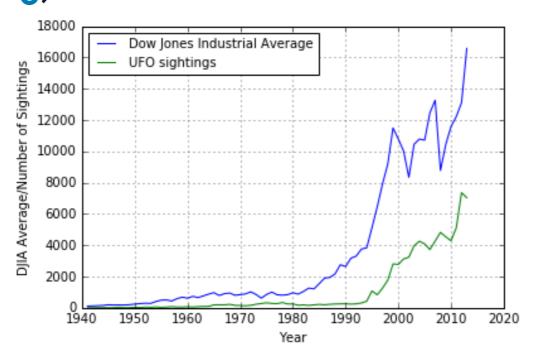

• Corelation = 1.0

Common Mistake: Correlation of Two Trending Series

 Dow Jones Industrial Average and UFO Sightings (www.nuforc.org)

- Correlation of levels: 0.94
- Correlation of percent changes: pprox 0

Example: Correlation of Large Cap and Small Cap Stocks

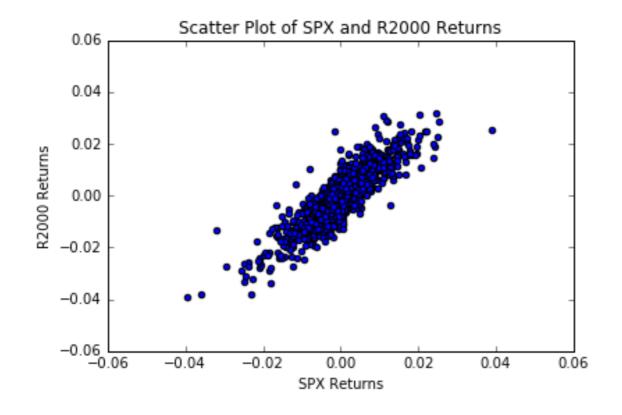

- Start with stock prices of SPX (large cap) and R2000 (small cap)
- First step: Compute percentage changes of both series

```
df['SPX_Ret'] = df['SPX_Prices'].pct_change()
df['R2000_Ret'] = df['R2000_Prices'].pct_change()
```

Example: Correlation of Large Cap and Small Cap Stocks

Visualize correlation with scattter plot

```
plt.scatter(df['SPX_Ret'], df['R2000_Ret'])
plt.show()
```

Example: Correlation of Large Cap and Small Cap Stocks

Use pandas correlation method for Series

```
correlation = df['SPX_Ret'].corr(df['R2000_Ret'])
print("Correlation is: ", correlation)
```

Correlation is: 0.868

Let's practice!

TIME SERIES ANALYSIS IN PYTHON

Simple Linear Regressions

TIME SERIES ANALYSIS IN PYTHON

Rob Reider

Adjunct Professor, NYU-Courant Consultant, Quantopian

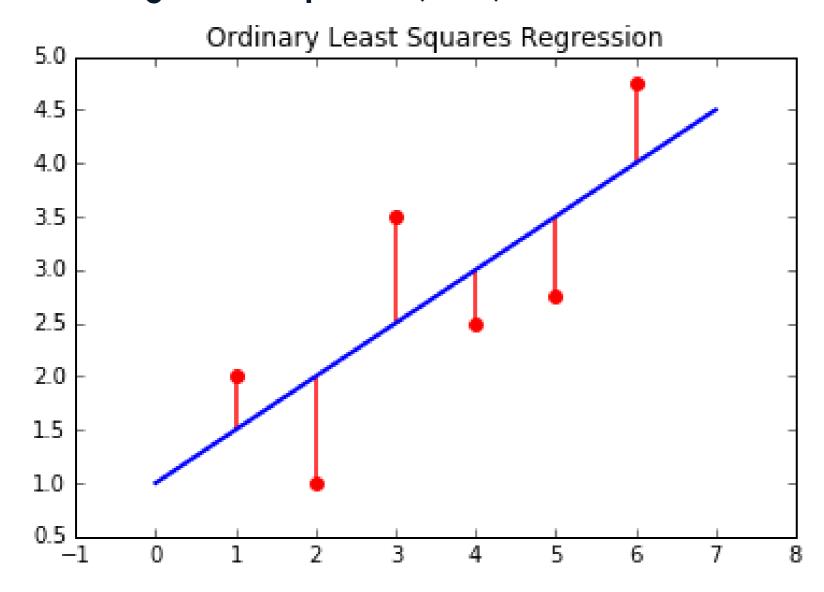

What is a Regression?

• Simple linear regression: $y_t = lpha + eta x_t + \epsilon_t$

What is a Regression?

Ordinary Least Squares (OLS)

Python Packages to Perform Regressions

In statsmodels:

```
import statsmodels.api as sm
sm.OLS(y, x).fit()
```

In numpy:

```
np.polyfit(x, y, deg=1)
```

• In pandas:

```
pd.ols(y, x)
```

• In scipy:

```
from scipy import stats
stats.linregress(x, y)
```

Warning: the order of x and y is not consistent across packages

Example: Regression of Small Cap Returns on Large Cap

Import the statsmodels module

```
import statsmodels.api as sm
```

• As before, compute percentage changes in both series

```
df['SPX_Ret'] = df['SPX_Prices'].pct_change()
df['R2000_Ret'] = df['R2000_Prices'].pct_change()
```

Add a constant to the DataFrame for the regression intercept

```
df = sm.add_constant(df)
```

Regression Example (continued)

Notice that the first row of returns is NaN

```
SPX_Price R2000_Price SPX_Ret R2000_Ret

Date
2012-11-01 1427.589966 827.849976 NaN NaN
2012-11-02 1414.199951 814.369995 -0.009379 -0.016283
```

Delete the row of NaN

```
df = df.dropna()
```

Run the regression

```
results = sm.OLS(df['R2000_Ret'],df[['const','SPX_Ret']]).fit()
print(results.summary())
```

Regression Example (continued)

OLS Regression Results							
Dep. Variable: Model: Method: Date: Time: No. Observations: Df Residuals: Df Model: Covariance Type:	R2000_Ret OLS Least Squares Fri, 26 Jan 2018 13:29:55 1257 1255 1	F-statistic: Prob (F-statistic): Log-Likelihood: AIC:	0.753 0.753 3829 0.06 4882.4 -9761 -9751

	======				========	========	=======

Relationship Between R-Squared and Correlation

- $[\mathrm{corr}(x,y)]^2=R^2$ (or R-squared)
- sign(corr) = sign(regression slope)
- In last example:
 - R-Squared = 0.753
 - Slope is positive
 - \circ correlation = $+\sqrt{0.753}=0.868$

Let's practice!

TIME SERIES ANALYSIS IN PYTHON

Autocorrelation

TIME SERIES ANALYSIS IN PYTHON

Rob Reider

Adjunct Professor, NYU-Courant Consultant, Quantopian

What is Autocorrelation?

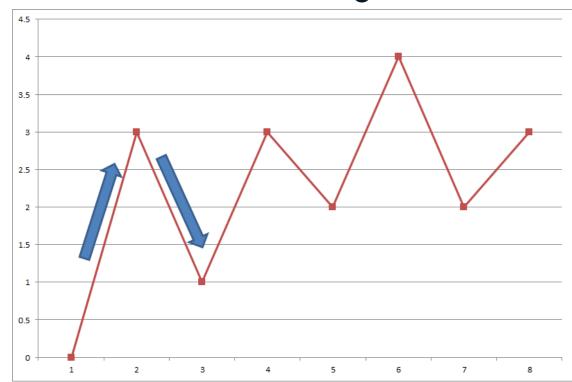

Correlation of a time series with a lagged copy of itself

Series	Lagged Series		
5			
10	5		
15	10		
20	15		
25	20		
:			

- Lag-one autocorrelation
- Also called serial correlation

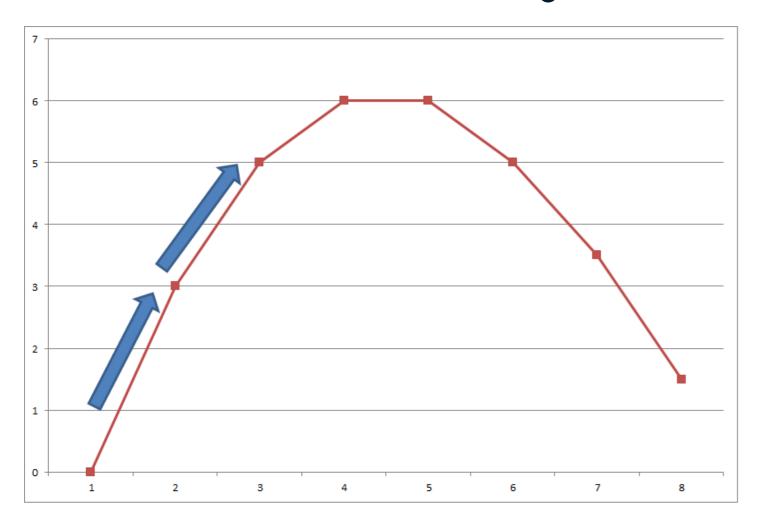

Interpretation of Autocorrelation

• Mean Reversion - Negative autocorrelation

Interpretation of Autocorrelation

• Momentum, or Trend Following - Positive autocorrelation

Traders Use Autocorrelation to Make Money

- Individual stocks
 - Historically have negative autocorrelation
 - Measured over short horizons (days)
 - Trading strategy: Buy losers and sell winners
- Commodities and currencies
 - Historically have positive autocorrelation
 - Measured over longer horizons (months)
 - Trading strategy: Buy winners and sell losers

Example of Positive Autocorrelation: Exchange Rates

- Use daily ¥/\$ exchange rates in DataFrame df from FRED
- Convert index to datetime

```
# Convert index to datetime
df.index = pd.to_datetime(df.index)
# Downsample from daily to monthly data
df = df.resample(rule='M', how='last')
# Compute returns from prices
df['Return'] = df['Price'].pct_change()
# Compute autocorrelation
autocorrelation = df['Return'].autocorr()
print("The autocorrelation is: ",autocorrelation)
```

The autocorrelation is: 0.0567

Let's practice!
